

Which of Your Projects Could Become a Business?

Commercial opportunities & go-to-market strategy for Guardian RAG, AutoFT and KRONOS

These three projects have different commercial possibilities. The key is to stop presenting them only as technical projects — and start positioning each one as the answer to a real business problem.

Each project below is framed the way a buyer would see it: the problem it addresses, who might pay, what could be sold, and what still has to be proven before it is offered commercially.

They are not equally ready. One can be offered as a scoped service first; one fits a specialised B2B audience; one is a longer-term product direction that needs a sharper focus.

Three projects, three commercial horizons

PROJECT 01 Guardian RAG Secure AI knowledge assistant POTENTIAL SERVICE TO SELL FIRST	PROJECT 02 AutoFT Self-maintaining LLM agents SPECIALISED B2B OPPORTUNITY	PROJECT 03 KRONOS AI workflow orchestration platform LONGER-TERM PRODUCT OPPORTUNITY
--	--	---

◀ Nearer term · defined engagement

Longer term · product investment ▶

THE PROBLEM

Companies have policies, PDFs, internal documentation and support manuals — but employees waste time searching for information.

THE SOLUTION

An AI assistant that answers questions using company documents, with role-based access, retrieval and access logs.

Restricted content is filtered out before it reaches the model — not trimmed from the answer afterwards.

🔗 Potential customers

- E-commerce businesses with large product and support documentation
- Startups with growing internal knowledge bases
- Companies with complex onboarding and operational manuals

📦 What you could sell

A **paid proof of concept** using a customer's selected documents, followed by a **customised deployment, integrations** and **ongoing maintenance**.

- 1 Paid PoC
- 2 Deployment
- 3 Integrations
- 4 Maintenance

COMMERCIAL CONSIDERATIONS

The existing RAG, access-control and logging work provides a foundation. Production security, reliability, deployment and data privacy still need to be validated before it is offered as a production-ready system.

Guardian RAG prototype: a cited answer drawn only from passages the signed-in role may read. Screenshot from the public repository, github.com/YousefHlaly/guardian-rag.

THE PROBLEM

Businesses deploying AI models need to monitor quality, detect data drift, evaluate performance, and decide when to retrain or replace models.

THE SOLUTION

A closed-loop system for monitoring, drift detection, QLoRA fine-tuning, evaluation, and controlled promotion or rejection of candidate models.

👤 Potential customers

- AI startups operating LLM-based products
- Companies with established ML pipelines
- AI engineering teams that need model evaluation and retraining workflows

📦 What you could sell

- AI/ML pipeline audits
- Evaluation frameworks
- Model-monitoring implementations
- Fine-tuning experiments
- *Eventually:* a managed model-lifecycle platform

COMMERCIAL CONSIDERATIONS

The technical approach is distinctive, but the commercial challenge is proving that automated retraining produces measurable savings or quality improvements over simpler monitoring and manual workflows.

AutoFT prototype dashboard: a real fine-tuning run and its promotion check. Screenshot from the public repository, github.com/YousefHlaly/AutoFT.

THE PROBLEM

Teams building AI applications often have disconnected tools for RAG, agents, data processing, fine-tuning and deployment.

THE SOLUTION

A visual platform for orchestrating AI workflows, connecting components, and managing their lifecycle.

Today these pieces usually live in separate tools. KRONOS connects them in one workflow.

 Potential customers

- AI development startups
- AI consultants and engineering teams
- Organisations experimenting with multi-agent applications

What you could sell

Custom AI workflow development, integration and orchestration — potentially followed by a **subscription-based platform**.

Now Custom workflows

Then Integration

Later Subscription

COMMERCIAL CONSIDERATIONS

A broad orchestration platform is difficult to differentiate. Focus on one specific workflow or customer segment before expanding.

KRONOS prototype: a multi-agent workflow on the orchestration canvas. Screenshot from the public case study, github.com/YousefHlaly/kronos-showcase.

How to Approach These Commercially

Start with **Guardian RAG** or a **focused AutoFT service**, because each can be described as a specific problem with a defined engineering engagement. Treat **KRONOS** as a longer-term product direction until a particular customer workflow is identified that existing tools do not adequately solve.

Start here

Guardian RAG — a scoped knowledge-assistant engagement

Or start here

AutoFT — a focused evaluation or monitoring service

Hold for later

KRONOS — until a specific, unsolved workflow appears

A practical sequence

1

Choose one customer segment

Narrow enough that the same problem repeats across companies.

2

Interview potential users

Learn their current workflow, pain points and what the problem costs them.

3

Identify a measurable problem

Something specific enough to test, with a number attached.

4

Offer a small paid PoC

With clear success criteria agreed before any work starts.

5

Measure and gather feedback

Compare the outcome with the criteria; ask what would make it worth more.

6

Decide: expand or productise

Use the results to grow the service — or invest in a repeatable product.

FINAL TAKEAWAY

Commercial success depends not only on technical capability, but also on validating customer demand, delivering measurable business value, and building trust through reliable implementation.

This document presents commercial hypotheses. It does not represent validated market demand, existing customers or revenue, and it does not claim that any of these projects is production-ready.
