

PRIVATE, MEASURABLE AI

AI assistants that know who is allowed to see what.

We build retrieval-based AI assistants, agent workflows and fine-tuning pipelines that run on **your own servers**, cite their sources, and are measured before they are trusted.

Guardian RAG: an HR manager gets a cited answer from a confidential section; the same question is withheld for other roles. Real screenshot.

What we can do for you

01

Permission-aware knowledge assistant

Staff ask policy questions in plain language and get cited answers — only from passages their role may read. Every answer and refusal is logged for audit. Runs fully on-premise.

02

Self-maintaining agents (AutoFT)

Your agent got quietly worse? We detect when the questions drifted, decide if retraining is worth it, fine-tune on your hardware, and ship only a model proven better on held-out data.

03

AI agents & product engineering

One well-scoped agent workflow with tools, traces and an evaluation gate — delivered with a React / Node product interface when you need one.

Evidence, not slides

3 layers

of access control in Guardian RAG: before search, inside PostgreSQL row-level security, and before the answer is sent.

HOLD

AutoFT's own gate refused to ship a fine-tune whose +0.049 gain was within measurement noise. We report that honestly.

100% local

All three systems run on local models via Ollama by default. No document has to leave your network.

At Techne we're looking for

- **2-3 pilot partners** — especially healthcare, education and legal teams with policy documents they can't put in a cloud AI tool. A 4-week pilot on your own documents and servers.
- **Mentors and accelerator programmes** who can pressure-test which industry to start with.
- **Applied-AI and software roles** — we're also open to the right team.

Yousef Mamdouh

AI/ML Engineer · technical lead

Led multi-track AI R&D at YOXEL Technology (Oct 2025 – Jun 2026): RAG security, autonomous fine-tuning, agent evaluation; supervised a junior engineer. Earlier: business data analyst (workflow automation, BI dashboards). B.Sc. Computer Science (Data Science), CIC.

Projects

Project	What it does	Status
Guardian RAG	Policy assistant with access control inside retrieval, per-passage classification, PostgreSQL row-level security and a tamper-evident audit log. github.com/YousefHlaly/guardian-rag	WORKING
AutoFT	Self-maintaining LLM agents. Watches real questions, detects drift statistically, decides if retraining is worth the GPU time, fine-tunes locally with QLoRA — and ships only if the new model measurably beats the one in production. github.com/YousefHlaly/AutoFT	EXPERIMENTAL
KRONOS	Local-first platform to build, run, evaluate and fine-tune multi-agent workflows on a visual canvas. Source available for review on request. kronos-showcase	CASE STUDY
Swarminal	Mazen's desktop IDE: a grid of real terminal panes, each running a shell or a CLI coding agent. github.com/sspotter/Swarminal	MAZEN'S PROJECT
Nest Invest	Graduation project (grade A): trading simulator with an LSTM forecasting service. AI by Yousef, front end by Osama.	PRIVATE CODE

KRONOS canvas — a tool-calling agent answering from a document collection, with live trace.

AutoFT — training run and promotion check (result: HOLD).

Want to see it live?

Ask us for a 5-minute demo on a laptop — switch roles and watch the same question get answered or refused.
